 - step-by-step procedure, 375–376
 - proposed methodology, 368
 - safety and privacy levels of data, 372, 373
 - stakeholders of healthcare data, 368–369

- Availability
 - CIA triad, 292–293
 - control and, 59
 - digital data, 135
 - interconnected machines, 20
 - interplanetary system, 216
 - mobile devices, 184
 - possible security attacks, 326

B

- BHEEM: blockchain based framework, 67, 70
- Big data
 - algorithms, 259
 - case studies, 206

Big data (cont.)

- CC technology, 4
- chronic disease prediction, 255
- cloud layer, 198–199
- comparison, 195, 196
- and computational analysis, 507–508
- device layer, 197
- fog-based, 7
- fog layer, 198
- in healthcare, 113, 193–195
- and healthcare 4.0, 199–200
- vs. IoT
 - interdependency, 415
 - role, 415
 - tools (*see* Big data tools)
- organization, 206, 207
- security, 416
- smart grid systems, 26
- telehealth data, 107
- Yajna and Mantra (*see* Yajna and Mantra science)

Big data tools

- Microsoft HD Insight, 415
- MS Excel, 415
- PolyBase, 416
- Presto, 415

Biofeedback (BF)

- application in headache, 421
- audio-visual EMG and GSR, 433–440
- background and purpose, 431
- EEG experiments and discussion, 437, 441, 442
- EMG-GSR, 429
- emotional fulfillment, 431
- experiments and results
 - hypothesis, 433
 - variables, 433
- history, 420
- intervention, 431–432
- limitation, 447
- methodology and collection of data, 432
- novelties, 444–445
- quality of life, 441–442
- sensor modalities, 425
- significance, 447–448
- social impact and records, 421–422
- and TTH, 421, 428–431
- types
 - ECG, 426
 - EEG, 426
 - EMG, 426
 - GSR, 426–427

Biometrics

- authentication model, 358
- binary string, 357
- cloud-based, 359
- communication cost, 360
- consolidated summary, 363–367
- edge computing, 355
- e-passports, 358
- findings, 363
- healthcare domain, 357
- implementation of proposed methodology
 - case study and challenges, 379
 - experiments and results, 377–379
 - setup, 376
 - unknown user recognition, 376, 378
 - user recognition, 376, 377
 - user registration, 376, 377
- Iris recognition, 360–361
- proposed user authentication system (*see* Authentication)
- retina recognition, 361
- security protocol, 356, 357
- sensor nodes, 359
- statutory requirements
 - healthcare data security in India, 362
 - HIPAA, 362
- technological shift, 356
- user-specific requirements, 355

Blockchain

- BHEEM:blockchain based framework, 67
- client–server system technology, 310
- data security, 183
- fog-based IoT system, 309–310
- fog computing framework, 88
- privacy, 47

BodyEdge architecture, 149–150**Breast cancer**

- diagnosis, 482
- IT structures, 481
- mammogram, 483–484
- MRI, 484
- related works, 482–483
- simulation results (*see* Simulation)
- T-N-M classification, 482
- ultrasound, 484–485

C

- Clinical speech processing chain (CLIP), 113, 116, 127
- Cloud computing (CC), 217, 280, 454, 594–595
 - benefits, 58–59

- challenges, 272–274
- characteristics, 271–272
- in healthcare application, 18, 19
 - big data, 188
 - medical imaging, 189
 - research, 187–188
 - telecardiology, 187
 - telemedicine, 186
- high-priced technology, 8
- latency and privacy gap, 5
- notations, 133
- resources, 4
- secured storage and retrieval, 568
- service model
 - community, 185
 - hybrid computing, 185–186
