## The Editorial Policy for Proceedings

The series Lecture Notes in Physics reports new developments in physical research and teaching – quickly, informally, and at a high level. The proceedings to be considered for publication in this series should be limited to only a few areas of research, and these should be closely related to each other. The contributions should be of a high standard and should avoid lengthy redraftings of papers already published or about to be published elsewhere. As a whole, the proceedings should aim for a balanced presentation of the theme of the conference including a description of the techniques used and enough motivation for a broad readership. It should not be assumed that the published proceedings must reflect the conference in its entirety. (A listing or abstracts of papers presented at the meeting but not included in the proceedings could be added as an appendix.)

When applying for publication in the series Lecture Notes in Physics the volume's editor(s) should submit sufficient material to enable the series editors and their referees to make a fairly accurate evaluation (e.g. a complete list of speakers and titles of papers to be presented and abstracts). If, based on this information, the proceedings are (tentatively) accepted, the volume's editor(s), whose name(s) will appear on the title pages, should select the papers suitable for publication and have them refereed (as for a journal) when appropriate. As a rule discussions will not be accepted. The series editors and Springer-Verlag will normally not interfere with the detailed editing except in fairly obvious cases or on technical matters.

Final acceptance is expressed by the series editor in charge, in consultation with Springer-Verlag only after receiving the complete manuscript. It might help to send a copy of the authors' manuscripts in advance to the editor in charge to discuss possible revisions with him. As a general rule, the series editor will confirm his tentative acceptance if the final manuscript corresponds to the original concept discussed, if the quality of the contribution meets the requirements of the series, and if the final size of the manuscript does not greatly exceed the number of pages originally agreed upon. The manuscript should be forwarded to Springer-Verlag shortly after the meeting. In cases of extreme delay (more than six months after the conference) the series editors will check once more the timeliness of the papers. Therefore, the volume's editor(s) should establish strict deadlines, or collect the articles during the conference and have them revised on the spot. If a delay is unavoidable, one should encourage the authors to update their contributions if appropriate. The editors of proceedings are strongly advised to inform contributors about these points at an early stage.

The final manuscript should contain a table of contents and an informative introduction accessible also to readers not particularly familiar with the topic of the conference. The contributions should be in English. The volume's editor(s) should check the contributions for the correct use of language. At Springer-Verlag only the prefaces will be checked by a copy-editor for language and style. Grave linguistic or technical shortcomings may lead to the rejection of contributions by the series editors. A conference report should not exceed a total of 500 pages. Keeping the size within this bound should be achieved by a stricter selection of articles and not by imposing an upper limit to the length of the individual papers. Editors receive jointly 30 complimentary copies of their book. They are entitled to purchase further copies of their book at a reduced rate. As a rule no reprints of individual contributions can be supplied. No royalty is paid on Lecture Notes in Physics volumes. Commitment to publish is made by letter of interest rather than by signing a formal contract. Springer-Verlag secures the copyright for each volume.

## The Production Process

The books are hardbound, and the publisher will select quality paper appropriate to the needs of the author(s). Publication time is about ten weeks. More than twenty years of experience guarantee authors the best possible service. To reach the goal of rapid publication at a low price the technique of photographic reproduction from a camera-ready manuscript was chosen. This process shifts the main responsibility for the technical quality considerably from the publisher to the authors. We therefore urge all authors and editors of proceedings to observe very carefully the essentials for the preparation of camera-ready manuscripts, which we will supply on request. This applies especially to the quality of figures and halftones submitted for publication. In addition, it might be useful to look at some of the volumes already published. As a special service, we offer free of charge  $\LaTeX$  and  $\TeX$  macro packages to format the text according to Springer-Verlag's quality requirements. We strongly recommend that you make use of this offer, since the result will be a book of considerably improved technical quality. To avoid mistakes and time-consuming correspondence during the production period the conference editors should request special instructions from the publisher well before the beginning of the conference. Manuscripts not meeting the technical standard of the series will have to be returned for improvement.

## Preface

In many areas of theoretical physics, geometrical and functional analytic methods are used simultaneously. During the course of our studies and education, these methods appeared to be extremely different. For classical field theories, a differential complex over smooth manifolds, smooth sections of vector bundles over manifolds, principal fibre bundles, connections, curvatures, etc. are introduced. For quantum field theory, singular operator-valued distributions act on Fock space and lead to all the well-known difficulties. After the work of Alain Connes and the many applications of non-commutative geometry to various subjects, we became familiar with, for example, the fact that on any associative superalgebra at least one differential calculus exists. But clearly there are many more aspects. We selected seven subjects and lecturers to cover symplectic geometry, quantum gravity, string theory, an introduction to non-commutative geometry, and the application to fundamental interactions, to the quantum Hall effect as well as to physics on  $q$ -deformed spaces.

In the first contribution, Anton Alexseev uses techniques of symplectic geometry to evaluate certain integrals over manifolds that have special symmetries. For them the stationary phase approximation becomes exact. Starting from simple examples, he introduces equivariant cohomology and sketches the proof of localization formulas of Duistermaat - Heckman type. The Weil model, well-known from the BRST formalism, is introduced, and a non-commutative generalization is used to prove group-valued localization.

John Baez elucidates the present status of quantum geometry of space-time. Since the implementation of constraints within the Hamiltonian approach to Einstein gravity is complicated, he explains in detail the simplifying BF system connected to the Chern - Simons model. We learn about spin net works and spin foams, become familiar with triangulations of four-manifolds, and calculate spectra of quantum tetrahedra. His lecture notes not only survey the subject, but also give an extensive list of references arranged according to nine different subjects.

Cesar Gomez then gives an introduction to string theory. Starting from the mode expansion he explains  $T$ -duality, a symmetry relating closed strings of radius  $R$  and  $1/R$ . Next  $D$ -brane ideas are represented.

Both quantum gravity and string theory have their own way of treating space-time. But there is a further approach that goes by the name of non-commutative geometry. This is the subject of the chapter by Daniel Kastler.

John Madore introduces a differential complex over an arbitrary associative algebra. We learn that, depending on the procedure, a regularization effect may result. Attempts to add a gravitational field are also reviewed.

This introduction is useful to follow the lectures of Daniel Kastler. He spoke about Connes' approach to the standard model as well as recent ideas for including gravity as an external field. He presents the interesting idea that

additional dimensions finally lead via the Higgs effect to masses of particles, as well as the recent attempts to use  $SU_q(2)$  for  $q$  being a third root of unity to “deduce” the gauge group of the standard model.

Julius Wess applies ideas of non-commutative geometry to the  $q$ -deformed Heisenberg algebra. The spectra of position and momentum are discrete. Phase space gets a lattice-like structure. Higher-dimensional analogues are investigated too.

Finally, Ruedi Seiler explains geometrical properties of transport in quantum Hall systems. The integer effect is treated in detail.

Although we learn here about many different applications of non-commutative geometry, the hope is that a unique picture of a quantum space-time may finally result. Quantum theory changes our ideas on geometry, and further surprises may come along soon.

We have tried to cover many subjects and were lucky to be supported by so many excellent lecturers. We hope that the school helped young people seeking an entry to these subjects. They will hopefully remember the excellent atmosphere of the Schladming Winter School 1999.

At this point we also want to express our thanks to the main sponsor of the School, the Austrian Ministry for Science and Transportation. In addition, we gratefully acknowledge the generous support by the Government of Styria and the Town of Schladming. Valuable help towards the organization was received from the Wirtschaftskammer Steiermark (Sektion Industrie), Steyr-Daimler-Puch AG, Ricoh-Austria, and Styria Online.

Organizing the 1999 Schladming Winter School, and making it the successful event that it was, would not have been possible without the help of a number of colleagues and graduate students from our institute. Without naming them all we want to acknowledge the traditionally good cooperation within the organizing committee and beyond, which once again guaranteed the smooth running of all organizational, technical, and social matters. Thanks are due to Wolfgang Schweiger for his valuable technical assistance. Finally we should like to express our sincere thanks to Miss Sabine Fuchs for carrying out the secretarial work and for finalizing the text and layout of these proceedings.

Graz, November 1999
